Android as a Platform for Internet of Things

Android is being adopted by IoT OEMs en-masse. While the promises of Android are many, it is also true that adapting Android to your device is much more complex, and unless you do it right, Android will seem more of a burden than a benefit to the end users. While there are many Android application developers, there are very few specialized Android customization engineers and companies with a proven track record. Read

our in-depth analysis of how Android fares as a platform for Internet of Things...

SON over Wi-FI

Wireless LAN technology is an indispensable part of the enterprise network. As the network increases, managing tens of thousands of Access Points (APs) becomes an issue. This leads to the requirement of self-configuring, self-managing and self healing networks. SON (Self optimizing networks) is the answer to this.

Bigdata technology for Asset Tracking

Consider an Asset Tracking System which offers 'location-based asset tracking' as a Service. A traditional asset tracking solution which could barely support tracking 10,000 assets, can be re-engineered to track millions of assets, by using bigdata technologies.

Whitepaper : Test Automation Tools for Mobile Applications

While UI test automation is well understood for the desktop market, with a plethora of good tools available, the mobile market is different. Due to platform fragmentation and restrictions imposed by mobile device OSs, UI automation is a harder problem to solve.
